GENERAL RELATIVITY AND UNIFIED FIELD THEORIES

Contents

Contents p.i

1. Special Relativity. p.1

- 1.1 The basic principles. p.1
- 1.2 The Energy-Momentum tensor. p.54
- 1.3 Relativistic Hydrodynamics. p.61
 - 1.3.1 Perfect fluids. p.61
 - 1.3.1.a Non-relativistic fluids. p.61
 - 1.3.1.b Relativistic fluid. p.69
- 1.4 Lagrangian systems. Momentum-Energy tensor. p.84

2. General relativity—The field equations. p.95

- 2.1 Gauge fields. p.95
- 2.2 The basic principle—A general overview. p.98
 - a. Einstein's principle of Equivalence—Strong and weak form—Mathematical formulation. pp.105-110
- 2.3 Space and Time as a Lorentzian manifold—Mathematical formulation of the Principle of Equivalence. p.109
 - a. The derivation of Einstein's field equations using the gauge invariant Lagrangian. pp.111-120
 - b. The ideal fluid. pp.120-128
 - c. Nonlocalizability of Gravitational Energy. pp.128-131
 - d. Motion of a test body in a gravitational field. pp.131-139
 - e. A brief way of derivation for the same results. pp.140-142
 - f. Relativity and classical gravity—Computation of the constant k . pp.143-148
- 2.4 Gravitational waves—The linear approximation. p.149
- 2.5 Intervals of Proper time and Distance. p.169
- 2.6 The Tetrad formalism. p.175
 - 2.6.1 General principles. p.175
 - 2.6.2 The covariant derivative. p.186
 - 2.6.3 Formulation of Einstein's field equations in terms of differential forms (Tetrad formalism). p.198

2.7 Remarks on the Cauchy problem. p.217

2.8 Causal Structure. p.223

3. Spherically symmetric gravitational fields—Axially symmetric solutions—Black holes. p.233

3.1 Spherically Symmetric Gravitational fields. p.233

3.2 The Schwarzschild solution. p.254

3.2.1 Spherically Symmetric Solutions for a Fluid. p.254

3.2.2 The exterior Schwarzschild solution (external). p.256

3.2.3 The internal solution. p.267

3.2.4 Equation of Motion in a Schwarzschild Field. p.274

3.3 The extended Schwarzschild solution—Black holes. p.281

3.3.1 Geodesics in the vicinity of the horizon. p.281

3.3.2 The Kruskal-Szekeres Continuation of the Schwarzschild solution. p.287

3.3.3 The Eddington-Finkelstein coordinates. p.299

3.4 The Reissner-Nordstrom solution. p.313

3.4.1 The extended Reissner-Nordstrom solution. p.325

4. Logunov's Relativistic Theory of Gravity (R.T.G.). p.327

1. The geometrization principle. p.327

2. Variation of the Lagrangian and useful identities. p.340

3. Transformations of coordinates and gauge group of transformations. p.346

3.1 Coordinate transformations. p.346

3.2 Gauge transformations. p.350

4. Density of the Lagrangian. p.359

5. Equations of motion. p.368

6. Analysis of a symmetric second rank tensor into a direct sum of irreducible representations. p.373

7. A Generalization of the RTG system of equations. p.383

8. Variational derivatives of L_g with respect to the metric of Minkowski space $\gamma_{\mu\nu}$. p.397

9. Gauge invariants in Gravitation (GR) Theory. p.407
